In 1990, researchers at Celera Genomics and at the National Human Genome Research Institute began an ambitious endeavor to sequence the entire human genome. In 2003, the project was completed, resulting in the sequencing of all human chromosomes. The Human Genome Project revealed that the human genome contains only 20,000 to 25,000 genes.

The Human Genome Project (HGP), which operated from 1990 to 2003, provided researchers with basic information about the sequences of the three billion chemical base pairs (i.e., adenine [A], thymine [T], guanine [G], and cytosine [C]) that make up human genomic DNA (deoxyribonucleic acid).

DNA Sequencing and the Human Genome - Study.com

The human genome includes the coding regions of DNA, which encode all the genes (between 20,000 and 25,000) of the human organism, as well as the noncoding regions of DNA, which do not encode any genes. By 2003 the DNA sequence of the entire human genome was known.

Summary. The Human Genome Project was a collaborative effort where scientists uncovered all the genes in the human genome. This was a hugely ambitious project given the state of technologies at the time. Sanger sequencing was the key technology for sequencing human genomes, which involves using chain terminating nucleotides.
