The OpenMP programming model is defined by an open standard and has well-defined bindings to the Fortran and C/C++ programming languages. OpenMP versions 2.0 and 2.5, which are supported by the Microsoft C++ compiler, are well-suited for parallel algorithms that are iterative; that is, they perform parallel iteration over an array of data.

OpenMP parallel for construct OpenMP parallel for construct was used to parallelize the summation. It was observed that, for a typical large array with array size greater than or equal to 2^20, the time taken to execute the program using a parallel for construct is less than serial execution of the same.

Concurrent and parallel programming languages involve multiple timelines. Such languages provide synchronization constructs whose behavior is defined by a parallel execution model. A concurrent programming language is defined as one which uses the concept of simultaneously executing processes or threads of execution as a means of structuring a program. A parallel language is able to express programs that are executable on more than one processor.

From the point of view of abstraction, we use of a high-level parallel ap-plication programming interface (API), such as OpenMP [25], to identify two parallel sections (per iteration of the DMF algorithm) that become coarse-grain tasks to be run in parallel. Within some of these coarse tasks, we employ OpenMP as well to extract

Is there a difference between parallel programming and ...

OpenMP is a particularly simple parallel programming notation. It works on shared-memory computers. This means you can work with tasks without the need to explicitly decompose your data. However, this also means you can easily create a program with accidental data sharing which can lead to the race conditions we discussed in part 3.

1.6 Parallel Programming Languages and Models. Many parallel programming languages and models have been proposed in the past several decades [Mattson, 2004]. The ones that are the most widely used are message passing interface (MPI) [MPI 2009] for scalable cluster computing, and OpenMP [Open 2005] for shared memory multiprocessor systems. Both have become standardized programming interfaces supported by major computer vendors.
